

JADEITE VENTURES

Jadeite Intelligence Hub

Admin User Journey & Functional Scope

A step-by-step explanation of what the Admin will do, see, review and approve inside the internal web platform.

Project	Unified Portfolio Management & Intelligence Platform
Primary User	Jadeite Ventures Admin / Management
Coverage	All Jadeite Ventures portfolio companies
Version	Final Working Scope - 19 July 2026

Creating legacies through clear information, accountability and practical execution.

A

Purpose of this document

Written from the Admin's point of view

This document explains the website as a journey. It does not begin with technical terminology. It begins with the Admin logging in, reviewing the portfolio, opening a company, managing employees and KPIs, reviewing bonuses and financials, and completing approvals.

For every stage, the document explains two things: what the Admin can do and what the Admin will see. The same journey will later be converted into the website blueprint, wireframes and clickable prototype.

Core platform purpose

- Provide one internal web platform for all Jadeite Ventures companies.
- Give management a consolidated view while keeping company and role access restricted.
- Connect company performance, employees, KPIs, bonuses, financials, equity, tasks, documents, e-commerce reporting, campaign intelligence, approved data integrations and role-aware AI assistance.
- Support decision-making without making the website difficult to understand or operate.
- Use an integration-first approach: most available data should be pulled automatically from Shopify, Meta, ERP/accounting, advertising, social-media, shipping, payment and other approved systems.
- Give every authorized employee an AI assistant that improves daily work while following the employee's company, role, permissions and confidentiality rules.
- Keep high-risk actions under human control. AI may analyse and recommend, but it cannot approve payments, change KPIs or bonuses, alter financial records, send external communications or change campaigns without authorized approval.

Companies covered

Portfolio Stage	Admin view
Startup / R&D	Milestones, product readiness, budget use, suppliers and launch risks
Active Management	Sales, profitability, cash flow, inventory, KPIs and team execution
Growth	Revenue growth, profitability, cash flow, expansion, governance and management
Pipeline	Due diligence, valuation, terms, legal review, risks and investment approval

Admin journey at a glance

Step	Destination	Main purpose
1	Login	Enter the secure internal platform
2	Admin Home	See the whole portfolio and urgent items
3	Companies	View all companies or group them by stage
4	Company Workspace	Review the company overview, switch between department tabs and open detailed modules.
5	Employees	Manage users, roles, departments and access
6	KPIs	Set, review and finalize company and employee KPIs
7	Bonuses	Track progress, calculate, review and approve bonuses
8	Financials	Review statements, budgets, forecasts and cash flow
9	Equity & Consolidation	See full results and Jadeite's equity-adjusted share
10	E-Commerce	Review sales, customer, marketing and monthly operational updates
11	Integrations & AI	Connect Shopify and marketing platforms, monitor data quality and run AI analytics
12	Tasks & Approvals	Assign actions and clear pending approvals
13	Documents & Reports	Control records, exports and management reporting
14	Users & Settings	Manage permissions, templates and system rules

B

Admin website navigation

The main menu visible after login

The left-side menu should remain simple and consistent. The Admin can move between the group view and individual company workspaces without losing the selected company or reporting period.

Menu	What opens
Home	Group overview, alerts, approvals and portfolio status
Companies	All companies, stage view, add company, open workspace and move between department dashboards.
Employees	Employee database, roles, access, KPI and bonus status
KPIs	Company KPIs, employee KPIs, quarterly review and appeals
Bonuses	Progress, calculation, cash review, approvals and payment status
Financials	Company statements, budgets, forecasts and consolidated results
E-Commerce	Company dashboards, comparison, monthly reviews and data entry
Integrations & AI	Connected accounts, sync status, data quality, AI analysis and recommendations
AI Assistant	Role-aware employee and management assistant for analysis, summaries, drafts, task planning, KPI guidance and recommendations
Tasks	Central action tracker and overdue escalations
Approvals	One place for pending management decisions
Documents	Company files, version history, access and expiry reminders
Reports	Portfolio, company, employee, financial and e-commerce reports
Notifications	In-platform alerts relevant to the Admin
Users & Settings	Roles, permissions, templates, rules and integrations
Audit History	Complete record of important changes and approvals

1

Secure login

The Admin enters the internal platform

What the Admin does	What the Admin sees
• Opens the Jadeite Intelligence Hub website.	• Jadeite Ventures branding.
• Enters email and password.	• Secure login fields and password recovery.

• Completes multi-factor authentication where required.	• Privacy and access notice.
• Selects the company only if the Admin has restricted access.	• Clear error message if access is denied.

Management, finance, HR and system administrators should use stronger login controls because they can access sensitive information.

2

Admin home dashboard

The first screen after login

The Home Dashboard should answer one question immediately: "What needs my attention today?" It should not show every available metric at once.

What the Admin can do	What the Admin sees
• Change the reporting period.	• Total companies by portfolio stage.
• Open a company directly.	• On Track, Needs Attention, At Risk and Critical companies.
• Open an alert, overdue action or pending approval.	• Portfolio revenue, profit or loss and cash position.
• Switch between full portfolio results and Jadeite equity-adjusted results.	• Employee KPI completion and estimated bonus exposure.
• Export a short management summary.	• Overdue tasks, pending approvals and important alerts.

Recommended Home Dashboard layout

Area	Information shown
Top summary	Portfolio status, total revenue, net profit/loss, cash and equity-adjusted result
Company status	Companies requiring attention, reason and latest update
People	KPI review status, appeals, bonus exposure and missing evaluations
Actions	Overdue tasks, approvals due and documents expiring
Alerts	Cash, financial, inventory, e-commerce and system integration alerts

3

Portfolio companies

View all companies or group them by stage

What the Admin can do	What the Admin sees
• View all companies together.	• Company name and logo.
• Group companies by Startup/R&D, Active Management, Growth or Pipeline.	• Portfolio stage and current status.
• Search, filter and sort companies.	• Main target and current achievement.
• Open a company workspace.	• Jadeite equity percentage.
• Add a new company or pipeline opportunity.	• Key risk, pending action and date of last update.

Add a new company

When the Admin selects "Add Company", the platform should use a guided setup rather than one long form.

The Admin should also be able to deactivate or archive a portfolio company easily. Archiving removes it from active views while keeping financials, KPIs, documents, approvals and audit history. Archived companies can be restored. Permanent deletion should be restricted to a Super Admin, require confirmation and be unavailable where records must be retained.

Setup step	Admin enters or selects
1. Basic profile	Company name, logo, business description and industry
2. Portfolio setup	Stage, management owner, founder or GM and reporting currency
3. Ownership	Jadeite equity percentage and effective date
4. Reporting	Financial frequency, KPI period and company status rules
5. Workspace	Sections required for this company
6. Access	Users, roles and company-level permissions
7. Lifecycle control	Activate, deactivate, archive or restore the company; record the reason and effective date

4

Company workspace

The Admin opens one company in detail

Each company has its own workspace. The selected company's logo must appear at the top-left of the company header beside the company name, status and reporting period. Directly below the header, the Admin

and authorized users can move between department tabs. The available tabs may differ by company, while the core modules remain available through the relevant department dashboards.

What the Admin can do	What the Admin sees
• Change the reporting period.	• Targets versus actual performance.
• Review performance and open detailed sections.	• Financial position and cash flow.
• Add management comments and risks.	• Company and employee KPI achievement.
• Assign actions directly from a weak metric.	• Key risks, overdue tasks and pending approvals.
• Override the suggested company status with a written reason.	• Automatic company status and the reason behind it.
• Open Finance, HR, Marketing, E-Commerce, Operations or other approved department tabs.	• Each department's own dashboard, with information and actions appropriate to that department.
4A	Department dashboards Role-based tabs inside every company workspace
What the Admin can do	What the Admin sees
• Add, rename, reorder, activate or deactivate department tabs for each company.	• A company header with the selected company logo at the top-left, together with the company name, status and reporting period.
• Choose the departments that apply to the company, such as Finance, HR, Marketing, E-Commerce, Sales, Operations, Product/R&D or another approved department.	• Clear department tabs directly below the company header; users only see the tabs they are permitted to access.
• Assign access by company, department, user role, individual user, module, item and action.	• A separate dashboard for every department, showing only its relevant KPIs, financials, tasks, approvals, documents, alerts and AI insights.
• Set whether a user can view, add, edit, submit, review, approve, reject, download, export or share information within each department.	• Easy movement between department dashboards without losing the selected company or reporting period.

- | | |
|--|--|
| <ul style="list-style-type: none"> • Use “View as this user” to confirm the exact department tabs and information available before access is activated. | <ul style="list-style-type: none"> • A consistent dashboard structure across companies, with company-specific departments, metrics and permissions. |
|--|--|

Company status logic

Stage	Status should mainly consider
Startup / R&D	Product readiness, milestones, budget use, team, supplier progress and risks
Active Management	Sales, profitability, KPIs, cash flow, inventory and team execution
Growth	Revenue growth, profitability, cash stability, expansion and governance
Pipeline	Due diligence, terms, valuation, legal review, approvals and key risks

5

Pipeline opportunity journey

From opportunity review to full company workspace

What the Admin can do	What the Admin sees
• Create a simplified pipeline workspace.	• Opportunity overview and founder information.
• Track due diligence, valuation, terms, legal review and risks.	• Due diligence checklist and completion status.
• Upload documents and record management comments.	• Valuation, commercial terms and approval history.
• Move the opportunity through approval stages.	• Open legal, financial and operating risks.
• Convert an approved opportunity into a full company workspace.	• Clear decision status: review, changes needed, approved or declined.

When converted, the platform must keep all due diligence documents, comments, approvals and decision history.

6

Employees and access

Manage people across all portfolio companies

What the Admin can do	What the Admin sees
• Add, edit, activate or deactivate employees.	• Employee name, company, department, role and manager.

• Assign company, department, job title and reporting manager.	• Employment and access status.
• Set role-based and company-based access.	• KPI period, review stage and achievement.
• Mark KPI and bonus eligibility.	• Bonus eligibility and estimated bonus status.
• Open an employee profile and review history.	• Assigned tasks and pending employee actions.
Department dashboards	Control which department tabs each role or individual user can see, and set separate action rights within every department.

Role-based homepage principle

Role	Default view
Jadeite Management	All companies, consolidated performance, risks and approvals
Founder / GM	Own company only
Finance	Financial reporting, cash, reconciliation and bonus cash review
HR	Employees, KPIs, bonuses, reviews and appeals
Manager	Own department, employees, KPIs and assigned actions
Employee	Own KPIs, progress, bonus percentage, comments and tasks
External User	Only the specifically approved company and sections

Granular access control

The Admin must be able to control access for every user, company, module and sensitive item. Role templates provide the default access, but the Admin can apply user-specific overrides when approved.

Permission level	Admin control
Scope	One company, selected companies, all companies, one department, selected employees or the complete group.
Actions	View, add, edit, submit, review, approve, reject, download, export, share, archive and delete.
Sensitive fields	Salary, bonus amount, bank balance, supplier cost, profitability tiers, equity, personal documents and audit history can be masked separately.
Temporary access	Grant access for a defined period and remove it automatically on expiry.
Preview	Use "View as this user" to confirm exactly what the person will see before access is activated.
History	Record who granted, changed or removed access, with date, reason and approval.

Employee AI Assistant

Every authorized employee should have an AI assistant inside the platform to enhance daily work. The assistant must use only the information that the employee is permitted to access.

- Summarize approved reports, dashboards, documents, meetings and assigned actions.
- Analyse the employee's company or department data and explain trends in simple English.

- Prepare drafts, internal updates, action plans, meeting notes and management summaries.
- Explain KPI progress and recommend practical actions that may improve achievement.
- Help marketing review campaigns, finance review variances, HR prepare KPI summaries, operations identify issues and management review portfolio performance.
- Show the sources, period and last refresh used in every material analysis.
- Never reveal data outside the employee's access, and never complete a high-risk action without separate human approval.

7

Company KPI management

Set and monitor the company's performance targets

What the Admin can do	What the Admin sees
• Create company KPIs and assign owners.	• KPI name, owner, target, actual and achievement.
• Set target, weight, reporting period and supporting documents.	• KPI weight and reporting period.
• Enter or approve actual performance.	• On Track or Below Target status.
• Link company KPIs to employee KPIs and bonuses.	• Comments, evidence and update history.
• Review KPI history and approved changes.	• Employees whose bonus is affected by the KPI.

8

Employee KPI setup and quarterly review

HR controls the process, managers and employees participate

Each employee can have both company-wide KPIs and role-specific KPIs. The percentage split can differ by employee or role and is decided by HR together with the employee's manager.

KPI setup

Admin / HR action	What is recorded
Assign KPIs	Company KPIs and individual KPIs
Set structure	Weight of every KPI and company/individual split
Set review period	Quarterly evaluation period
Set manager	Person required to review and comment
Activate KPIs	Final approved KPI plan for the quarter

Quarterly evaluation journey

Stage	Action	Outcome
1	HR enters actual results	The system calculates the initial achievement.
2	Manager reviews	Manager must review and add comments.
3	Employee reviews	Employee can see the result and add comments before finalization.
4	HR finalizes	HR approves and locks the final KPI score.
5	Employee receives result	The final score becomes visible in the employee dashboard.
6	Appeal if required	Employee may submit one review request with a written reason.

KPI appeal

HR and the employee's manager review the appeal together. The platform should display the original score, employee reason, supporting documents, manager comments, HR comments and final decision.

9

Bonus dashboard and approval

Show progress clearly without exposing the detailed formula

What the Admin can do	What the Admin sees
Review calculated bonus results after KPI finalization.	Employee, company and final KPI achievement.
Filter by company, employee, quarter, year and status.	Calculated bonus percentage and estimated amount.
Adjust a calculated bonus with a written reason.	Next bonus level and percentage still required.
Send bonuses for cash review and management approval.	Cash availability status for authorized users.
Update payment status after approval.	Approval and payment status.

Employee bonus view

- Current KPI achievement.
- Estimated bonus.
- Final bonus percentage.
- Next bonus level.
- Percentage still required to reach the next level.

Employees will not see the detailed bonus formula, company cash balance, confidential adjustments or other employees' bonuses.

Motivating KPI and bonus experience

The employee view should feel positive, exciting and action-oriented. A progress bar may be used, but it is not mandatory. The design should focus on what the employee can do next and encourage the employee to go the extra mile in a fair and ethical way.

Employee sees	Example experience
Current position	"You have achieved 104%. You are 2% away from the next bonus level."
Next best actions	Show the specific KPIs, tasks or milestones that can still improve the result.
Milestones	Use a progress path, level indicator, achievement badge, celebration or encouraging message when a milestone is reached.
Recognition	Highlight consistent improvement, timely completion and strong contribution without exposing other employees' confidential results.
Fairness	Do not create unhealthy competition, hide negative adjustments or encourage unsafe, unethical or misleading behaviour.

Bonus approval journey

Step	Status	What happens
1	KPI finalized	Bonus becomes ready for calculation
2	System calculates	Uses approved company or employee-group rules
3	HR reviews	May adjust only with a written reason
4	Finance cash review	Visible only to finance and management
5	Jadeite approval	Management approves, defers or rejects payment
6	Payment update	Approved, deferred, paid or cancelled

10

Company financials

Review complete financial performance for each company

What the Admin can do	What the Admin sees
Select month, quarter, year or custom period.	Profit and Loss, Balance Sheet and Cash Flow.
Review statements, budgets, forecasts and variances.	Budget, forecast and actual versus budget.
Upload Excel/CSV or use accounting integration.	Cash, receivables, payables and inventory value.
Add management comments and assign actions.	Financial ratios and previous-period comparison.
Approve or return a financial submission.	Missing submissions, negative cash and major variances.

Financial update frequency

Company stage	Required frequency
Startup / R&D	When major spending or key milestones occur
Active Management	Monthly
Growth	Monthly
Pipeline	Historical information, projections and investment scenarios

11

Equity and consolidated reporting

See full company results and Jadeite's equity-adjusted share

What the Admin can do	What the Admin sees
Record Jadeite's equity percentage.	Full company financial results.
Set the effective date and supporting document.	Jadeite's equity-adjusted share side by side.
Review changes and approval history.	Revenue, profit, cash, assets, liabilities and equity.
Open the consolidated financial dashboard.	Portfolio totals by stage and company.
Filter by company, stage, period, metric, budget and previous period.	Change history for every equity percentage update.

Example: if Jadeite owns 30% of a company, the platform will show the full result and Jadeite's 30% equity-adjusted share side by side.

Financial dashboard navigation

The Financials area should use three clear tabs so the Admin can move between views without rebuilding a report:

View	What the Admin sees
1. Standalone Portfolio Financials	The selected company's Profit and Loss, Balance Sheet, Cash Flow Statement, opening cash, receipts, payments, closing cash, budget, forecast, ratios and funding requirement.
2. Consolidated Financials - Full Results	Combined full results for all selected active portfolio companies, with filters by company, stage, period, currency and financial line.
3. Consolidated Financials - Jadeite Ownership	The same consolidated view adjusted automatically by Jadeite's ownership percentage in each company, shown side by side with full results.

The ownership-adjusted view is a management reporting view. Jadeite Finance must confirm the accounting treatment used for any statutory or audited consolidation.

12

E-Commerce dashboard

A core module for Qynda, Amaq, Yoghi and future e-commerce companies

The E-Commerce module should follow the attached Jadeite E-Commerce Dashboard structure. It must use simple one-click portfolio tabs at the top, retain the selected reporting period when switching companies, and work as part of the main platform with access, approval, history and audit controls.

12.1 Open the E-Commerce module

The Admin should see easy portfolio navigation at the top of the dashboard, similar to: Qynda | Amaq | Yoghi | Camel Glow | More. The active company is highlighted. Selecting another company changes the data immediately without returning to the main menu. When there are many companies, "More" opens a searchable list grouped by portfolio stage. An "All E-Commerce" option opens the consolidated view.

What the Admin can do	What the Admin sees
Select Qynda, Amaq, Yoghi or another e-commerce company.	Selected company and reporting period.
Select start month, end month and year.	Last data refresh and integration status.
Switch between company view, comparison view and consolidated view.	Monthly report status: Draft, Submitted, Under Review, Changes Requested, Approved or Locked.
Choose full results or Jadeite equity-adjusted results.	Shortcuts to data entry, written updates and target settings.
Switch between portfolio companies using top tabs without leaving the dashboard.	Active company highlighted; selected date range retained where possible.

12.2 Annual target versus actual

Metric	Dashboard should show
Gross Sales	Annual target, YTD actual, achievement and progress
Net Sales	Annual target, YTD actual, achievement and progress
Orders	Annual target, YTD actual and achievement
AOV	Target, actual and achievement
Conversion Rate	Target, actual and achievement
Returning Customers	Target, actual and achievement
Marketing Spend %	Approved cap, actual and lower-is-better status
ROAS	Target, actual and achievement

12.3 Selected-period KPI cards

First row	Second row
Gross Sales Target	AOV
Gross Sales Actual	Conversion Rate
Gross Achievement	Returning Customers
Net Sales Actual	Marketing Spend %
Orders	Blended ROAS

When the Admin changes the selected months, all figures must remain available and calculate consistently. Exact Shopify figures should not disappear when the month changes.

12.4 Monthly performance table

The Admin will see one row per month inside the selected range. The table should allow quick comparison and drill-through into the selected month.

Month-level fields
Gross target, gross actual and difference from target
Net actual and number of orders
AOV, conversion rate and returning customers
Marketing spend and ROAS
Status, comments and missing-data indicator

12.5 Written monthly updates

Update section	What the Admin reviews
Inventory & Purchase Orders	Stock position, stockouts, POs, arrival dates and delays
New Product Launches	Launches completed, upcoming products, progress and delays
Website Updates	Improvements, issues, landing pages, checkout and conversion work
Pipeline Activities	Campaigns, partnerships, retail, countries, channels and business development
Risk / Support Needed	Decision, owner, deadline and support required

12A

E-Commerce data, targets and approval

How the Admin controls the monthly report

12.6 Automatic data integrations and controlled manual entry

Most data should be extracted automatically from Shopify, Meta, the company ERP/accounting system, Google Ads, TikTok, approved social-media accounts, email/WhatsApp marketing, payment gateways, shipping systems and other approved platforms. Manual entry should be limited to information unavailable through integrations, commentary, approvals, authorized adjustments and exceptional corrections.

Data source	Use
Shopify	All available store data through approved Shopify APIs and permissions, including orders, products, customers, refunds, inventory and fulfilment.
Meta and social platforms	Meta Ads, Facebook and Instagram data such as spend, reach, impressions, clicks, conversions, engagement and creative performance, where access is permitted.
Google Ads and TikTok Ads	Campaign, ad group, ad, spend, traffic, conversion and ROAS data from connected advertising accounts.
Accounting and shipping systems	Financial reconciliation, profitability, payout, freight, fulfilment and return-cost information.
Excel / CSV / manual entry	Bulk uploads, historical backfills, corrections and approved data not available through an integration.
AI analytics layer	Combines approved platform data to produce summaries, anomaly detection, forecasts, comparisons and recommended actions.

Monthly actuals the Admin can review or enter

- Gross sales, net sales and orders.
- Exact AOV, website sessions and checkouts.
- Conversion rate and returning customer percentage.
- Marketing spend amount and blended ROAS.

Target settings

- Annual and monthly gross sales.
- Net sales and orders.
- AOV, conversion and returning customers.
- Marketing spend percentage and ROAS.
- Approved targets can be locked; any later change must be recorded.

Monthly e-commerce approval journey

Stage	Status	Admin journey
1	Draft	Company or authorized user prepares the monthly report
2	Submitted	Report is sent to the Admin for review
3	Under Review	Admin checks KPIs, written updates and missing data
4	Changes Requested	Report is returned with comments
5	Approved	Admin accepts the monthly report
6	Locked	Figures and comments are protected; reopening requires a reason

12.7 Comparison and consolidated e-commerce view

Company comparison	Consolidated view
Compare Qynda, Amaq, Yoghi and future e-commerce companies.	Total gross and net sales.
Compare one month, quarter, YTD, full year or custom range.	Total orders and weighted AOV.
Use individual targets so different company sizes remain understandable.	Overall conversion, returning customers, marketing spend and blended ROAS.
	Best-performing company and company requiring attention.

12.8 E-Commerce alerts

- Sales materially below target.
- Marketing spend above the approved cap.
- ROAS, conversion, AOV or returning customers below target.
- Best-selling products out of stock or high-return products.
- Monthly report incomplete or not submitted.
- Shopify or another integration is not updating.

12.9 Campaign Performance Dashboard

The Campaign Performance Dashboard is a core part of the E-Commerce module. It should show clearly which campaign is performing, which requires attention and why.

Area	Admin view
Navigation and filters	Company, platform, country, date range, campaign, ad set, ad, creative, channel and customer type.

Area	Admin view
Performance metrics	Spend, impressions, reach, clicks, sessions, purchases, revenue, new customers, CAC, nCAC, ROAS, nROAS and conversion.
Profitability	CM3 and CM4 where complete cost and attribution data are available; otherwise show the available metrics and identify missing inputs.
Creative view	Creative thumbnail, hook rate, hold rate, frequency, engagement and trend.
Simple status	Scale, Maintain, Review or Pause, with target comparison and a plain-English reason.
Drill-through	Click a campaign to open ad-set, ad, creative, country, product, customer and profitability details.
Action	Convert a finding into a task, comment or approval request. Campaign changes remain subject to authorized human approval.

12B

Advanced e-commerce intelligence

A later phase based on the attached technical specification

The main dashboard should remain simple. Campaign performance is a core dashboard. Detailed profitability, customer, country and reconciliation intelligence can sit behind restricted tabs for Executive, Finance and Marketing users.

Profitability waterfall

Level	Simple calculation
Net Sales	Gross sales less refunds and discounts
CM1	Net sales less cost of goods sold
CM2	CM1 less outbound shipping and payment gateway fees
CM3	CM2 less attributed advertising spend
CM4	CM3 less promotional discount erosion
CM5	CM4 less return shipping and reverse logistics costs

Restricted advanced views

Role	What may be visible
Executive	Full profitability, customer acquisition, cash and consolidated performance
Finance	Full profitability, accounting, tax, reconciliation and cash information
Marketing	Campaign profitability, CAC, nCAC, ROAS, nROAS and creative performance
Operations	Net sales, units, inventory, fulfilment, shipping and returns only

Possible later-phase intelligence

- Product and colour return rates, inventory velocity and days of stock remaining.
- Customer lifetime value, cohort payback and retention-channel contribution.
- Country profitability, shipping variance and shipping as a percentage of revenue.
- Advertising spend audit, payout-to-bank reconciliation and estimated tax liability.
- Automated suggestions such as scale, pause, reorder or investigate.

12C

Data integrations & AI analytics

Connect approved business data and turn it into clear management analysis

This section is a core part of the Admin journey. The platform must be integration-first: the Admin connects each company's approved systems, monitors sync health and data quality, and uses AI to understand performance without leaving the platform. Manual data should be the exception, not the default.

12C.1 Integration Center

What the Admin can do	What the Admin sees
Connect a Shopify store or advertising account to the correct company.	Company, platform, connected account, owner and access status.
Choose the historical start date and begin the first data import.	Import period, progress, records received and estimated completeness.
Test, pause, reconnect or remove an integration.	Connection health, last successful refresh and any error message.
Set the required refresh schedule for each source.	Live, hourly, daily or monthly refresh status, depending on the platform.
Review and resolve data-quality issues.	Missing fields, duplicate records, mismatched currency, attribution differences and required action.

12C.2 Shopify integration

Each e-commerce company should connect its own Shopify store. The requirement should be written as "all data available through approved Shopify APIs, permissions and plan capabilities," rather than promising every item visible inside Shopify Admin.

Shopify data area	Admin use inside Jadeite Intelligence Hub
Orders and sales	Gross sales, net sales, discounts, refunds, taxes, order status, channels and line items.
Products and inventory	Products, SKUs, variants, colours, inventory quantities, locations and product performance.
Customers	Customer profile, first order, repeat orders, new versus returning customer analysis and customer value.
Fulfilment and returns	Fulfilment status, shipping information, cancellations, returns and operational performance.

Shopify data area	Admin use inside Jadeite Intelligence Hub
Payments and payouts	Payment status, transaction and payout information where the approved Shopify access supports it.
Store analytics	Sessions, conversion and other analytics where available; if a metric is not available through the selected Shopify API, the system should use an approved report, pixel or connected analytics source.

- The first connection should import the agreed historical period, followed by scheduled updates and Shopify webhooks where suitable.
- Every company dashboard should show the last successful Shopify refresh and clearly alert the Admin when the connection stops updating.
- Manual corrections must not overwrite source data silently; every override requires a reason and audit history.

12C.3 Meta and other marketing-platform integrations

The platform should connect approved advertising and social accounts to the correct company. Advertising data and organic social data should remain separate because they serve different purposes and may have different access permissions.

Platform	Data the Admin may review
Meta Ads - Facebook and Instagram	Campaign, ad set and ad results; spend, impressions, reach, clicks, purchases, CPA, ROAS, frequency and creative name or preview where permitted.
Facebook and Instagram organic	Followers, reach, engagement, content performance and audience information where the relevant API and account permission allow access.
Google Ads	Campaign, ad group, keyword or asset performance; spend, impressions, clicks, conversions, conversion value and ROAS.
TikTok Ads	Campaign, ad group and ad reporting; spend, impressions, clicks, conversions, audience and ROAS where available.
Other approved platforms	Snapchat, Pinterest, YouTube or future channels selected during technical discovery and supported by official APIs.
Cross-platform reconciliation	Platform-reported conversions compared with Shopify orders and revenue, with differences clearly explained rather than combined blindly.

12C.4 AI Analytics Center

The AI tool should work as both a management analyst and an employee productivity assistant inside the platform. It should read only the data the logged-in user is allowed to see, explain findings in simple English and support role-relevant daily work.

12C.5 Employee AI Workspace

Every authorized employee can open the AI Workspace from the main menu or from the page they are working on. The assistant should understand the employee's role, company, assigned KPIs, tasks and permitted data.

Employee request	AI support
"Summarize what needs my attention."	Review assigned tasks, deadlines, KPI gaps, approvals and relevant alerts.
"Help me improve my KPI."	Explain the remaining gap and suggest practical next actions using approved data.
"Prepare my weekly update."	Draft a concise update from completed tasks, current risks and next steps.
"Analyse this report or campaign."	Explain performance, drivers, limitations and recommended follow-up.
"Find the relevant document."	Search only approved company documents and show the source used.
"Draft an email or action plan."	Create a reviewable draft; sending or changing records requires a separate authorized action.

Admin request	What the AI should provide
"Why did sales fall this month?"	Main drivers across traffic, conversion, AOV, returning customers, stock availability, campaigns, countries and products.
"Which company needs attention?"	A ranked portfolio view with the reasons, supporting metrics and recommended follow-up.
"Which campaigns should we review?"	Campaigns with weak ROAS, high acquisition cost, declining conversion or inconsistent Shopify sales.
"What is likely to happen next month?"	A forecast using available history, assumptions and a clear explanation of uncertainty.
"What actions should we take?"	Recommended actions such as investigate, reorder, pause for review, improve a landing page or assign an owner.
"Prepare my monthly review."	A management summary covering performance, risks, decisions, pending approvals and required actions.

12C.6 AI controls and safeguards

- AI will be read-only by default. It must not change campaigns, targets, KPIs, bonuses, financial records or equity information without an authorized user taking a separate approved action.
- Every AI answer should show the company, reporting period, data sources used, last refresh time and any important limitation or missing data.
- The Admin should be able to open the supporting dashboard or transaction behind an AI finding.
- The Admin can convert an AI recommendation into a task, comment or approval request, but the final decision remains with the authorized person.
- AI access must follow the same role, company and sensitive-data restrictions as the rest of the platform.
- Sensitive business and employee data must only be processed through approved and contractually controlled AI services.

12C.7 Admin journey for integrations and AI

Step	Admin journey
1	Open Integrations & AI from the main menu.
2	Select the company and connect its Shopify store, Meta account and other approved sources.
3	Confirm permissions, currency, timezone, historical period and account mapping.
4	Run the initial sync and review data completeness, errors and last refresh time.
5	Open the AI Analytics Center and select the company, period and management question.
6	Review the AI finding together with its supporting data and limitations.
7	Create an action, assign an owner, request approval or save the analysis in the monthly report.
8	Return to the Integration Center whenever a source stops updating or requires renewed access.

12C.8 Data governance requirements

- Create one approved definition for every important metric, including gross sales, net sales, orders, AOV, conversion, returning customers, marketing spend, ROAS and customer acquisition cost.
- Define the source of truth by data area: Shopify for commerce transactions, ERP/accounting for financial statements and costs, ad platforms for spend and engagement, carriers for actual shipping, payment gateways for fees and payouts, and approved HR records for employee data.
- Show source platform, source account, last successful sync, refresh frequency, data completeness and any manual override on the relevant dashboard.
- Store the original source data separately from adjusted or approved reporting values.
- Maintain historical data, source account mapping, currency conversion rules, timezone rules and refresh frequency.
- Show integration errors and missing data clearly instead of allowing the AI or dashboard to guess.
- Respect API permissions, platform limits, data-retention requirements and user privacy.
- Maintain a complete audit trail for connections, permissions, overrides, AI reports and actions created from AI recommendations.

13

Tasks, actions and approvals

Turn information into accountable execution

What the Admin can do	What the Admin sees
• Create and assign tasks from any company or dashboard.	• Tasks across all companies.

• Set owner, deadline, priority, status and approver.	• Owner, due date, priority and status.
• Add comments, reminders and attachments.	• Overdue days and escalation level.
• Approve completed work or request changes.	• Comments, attachments and approval history.
• Escalate overdue tasks.	• Filters by company, person, period and status.

Central approvals page

- KPI changes and final KPI reviews.
- Bonus-rule changes and bonus payments.
- Financial submissions and company status overrides.
- Equity changes, documents, tasks and user access.

14

Document library

Keep every company's important records in one controlled place

What the Admin can do	What the Admin sees
• Create folders and categories.	• Contracts and shareholder agreements.
• Upload, download, approve and replace files.	• Financial reports, budgets and policies.
• Set role-based access and document owner.	• Employee, KPI and bonus documents.
• Review version history and approval status.	• Legal, supplier and investment documents.
• Set expiry dates and use approved templates.	• Expiry alerts, version number and access history.

15

Reports, notifications and audit history

Management information, alerts and accountability

Reports

The Admin can generate portfolio, company, financial, employee, KPI, bonus, task, risk, document and e-commerce reports. Reports should be filterable and exportable to Excel and PDF.

In-platform notifications

- KPI review, finalization or appeal.
- Bonus review, cash review or management approval.
- Financial report missing or awaiting approval.
- Task assigned, deadline approaching or overdue.
- Document expiry, company status change or major risk.
- E-commerce performance or integration alert.

Audit history

The system must keep a complete history of important actions. The Admin can see who changed information, the previous value, the new value, the date and time, the reason and any related approval.

Audit coverage	Examples
People	Employee records, role changes and access
Performance	KPIs, targets, actuals, reviews and appeals
Compensation	Bonus calculations, adjustments, approvals and payments
Financials	Statements, imports, approvals and equity percentage
Operations	Tasks, documents, company status and settings

16

Users and system settings

Control who can see and change each part of the platform

User management	System settings
• Add, remove, activate or deactivate users.	• Companies, portfolio stages and departments.
• Assign role, company and department.	• KPI templates and bonus rules.
• Control section-level and data-level access.	• Reporting periods and company status rules.
• Review last login and access history.	• Task priorities, document categories and notification rules.

Per-user permission matrix

The Admin can open one user and control access item by item. Permissions can be inherited from the role, restricted by company, or overridden for the specific user. The system should warn the Admin when permissions conflict and keep a full history of every change.

Module or item	Available controls
Company and dashboards	View selected companies, all companies, consolidated views or no access.
Employees and HR	View profile, edit profile, view salary, view bonus, manage KPI, review or approve.
Financials and equity	View statements, cash flow, bank balance, costs, equity, export, submit or approve.
E-Commerce and campaigns	View sales, marketing spend, campaign detail, profitability, enter data, adjust or approve.
Documents and tasks	View, upload, edit, download, share, approve, archive or delete.
AI	Use AI on only the modules and data the user is already permitted to access.

C

The Admin's complete monthly journey

How the platform should work in practice

Step	Admin destination	Purpose
1	Open Home	Review portfolio status, alerts, overdue tasks and approvals
2	Review Companies	Open companies needing attention
3	Check KPIs	Review company and employee KPI progress
4	Review Bonuses	Check estimates, cash availability and approvals
5	Review Financials	Check submissions, variances, cash and risks
6	Review Equity View	Compare full results with Jadeite equity-adjusted share
7	Review E-Commerce	Check target versus actual and written updates
8	Review Integrations & AI	Check sync health, review AI findings and convert insights into actions
9	Use AI Workspace	Ask role-aware questions, prepare summaries and turn approved insights into actions
10	Assign Actions	Create owners, deadlines and required support
11	Clear Approvals	Approve, reject or request changes
12	Generate Report	Export the management summary and maintain audit history

Simple end-to-end flow

LOGIN	GROUP VIEW	COMPANY VIEW	REVIEW & APPROVE	REPORT & FOLLOW-UP
-------	------------	--------------	------------------	--------------------

D

Development approach

Prototype first, then phased development

Phase	What is included
1. Blueprint & Prototype	Sitemap, user flows, access matrix, wireframes and clickable prototype
2. Core Platform	Companies, easy portfolio navigation, employees, granular permissions, KPIs, motivating bonus experience, standalone and consolidated financials, equity, tasks, documents, campaign dashboard and audit.
3. Data Integrations	Integration-first data layer for Shopify, Meta, Google Ads, TikTok Ads, ERP/accounting, social media, email/WhatsApp marketing, payment, shipping and approved data imports.
4. AI Analytics	Role-aware AI for every authorized employee and management user, including analysis, summaries, anomaly detection, forecasts, KPI guidance, drafts, recommendations and safeguards.

Phase	What is included
5. Advanced Intelligence	Profitability waterfall, cohorts, country intelligence, reconciliation and advanced automated insights.
Department dashboard design	Clickable company-header and department-tab experience, including role-based dashboards and user permission examples.

Prototype approval checklist

- Admin can move from Group Dashboard to a company without confusion.
- Every screen clearly shows what the Admin can do and what the Admin can see.
- Role-based access is understandable before development begins.
- KPI, bonus, financial and e-commerce approval journeys are visible end to end.
- The platform remains simple even when advanced features exist behind restricted tabs.
- Portfolio tabs allow one-click navigation between companies without returning to the main menu.
- Within each company, department tabs provide one-click navigation between department dashboards without returning to the company overview.
- Every company workspace shows the selected company logo at the top-left of the header, together with the company name, status and reporting period.
- The Admin can configure department tabs and control exactly which tabs, modules, items and actions each role or individual user can access.
- Financial screens clearly show Standalone, Consolidated Full and Jadeite Ownership-adjusted views, including cash flow for each portfolio.
- The employee KPI and bonus view is motivating, action-oriented and clear about what remains to reach the next level.
- The Admin can preview and control access for every user, company, module, item and action.
- Campaign performance shows which campaigns to Scale, Maintain, Review or Pause, with supporting reasons.
- The prototype demonstrates automatic data sources, sync health, manual overrides and the Employee AI Workspace.

E

Expected deliverables

What the selected developer should provide

Deliverable	Description
Business blueprint	Final agreed platform structure and business rules
Admin user flow	Complete journey described in this document
Sitemap	All pages and navigation hierarchy
Role & access matrix	What every user type can view and change
Wireframes	Simple screen layouts before visual design
Clickable prototype	Realistic navigation for review and approval
UI design	Final branded desktop and responsive screens
Working platform	Developed, tested and deployed internal website

Deliverable	Description
Integration blueprint	Connected accounts, company mapping, data dictionary, refresh rules, source-of-truth logic and error handling.
Approved data connectors	Shopify and selected Meta, Google, TikTok, accounting, shipping and import connections.
AI analytics module	Secure, role-aware management analysis with source drill-through, alerts, forecasts and recommendations.
Integration monitoring	Last refresh, sync health, error alerts, reconnect flow and data-quality dashboard.
Integrations	Approved data connections and import methods
Testing & training	User acceptance testing, guides and training
Support plan	Post-launch maintenance, fixes and future improvements
Easy navigation prototype	Portfolio tabs and consolidated/standalone navigation demonstrated using the approved e-commerce dashboard pattern.
Granular permission matrix	Role, company, module, item and action-level permissions, including "View as user".
Campaign performance dashboard	Campaign, ad set, ad and creative performance with filters, simple status and drill-through.
Employee AI Workspace	Secure role-aware assistant for each authorized employee, with source references and human approval controls.
Portfolio lifecycle controls	Guided add-company flow plus deactivate, archive, restore and restricted deletion.
Financial view suite	Standalone portfolio financials, full consolidation and Jadeite ownership-adjusted consolidation, including cash flow.

Success criteria

- The Admin understands the full portfolio from one Home Dashboard.
- The Admin can open any company and see only relevant information.
- The Admin and authorized users can move easily between department dashboards inside the selected company.
- Each company page is clearly branded with the selected company logo in the top-left header.
- Employees can understand their KPI and bonus position clearly.
- Financials and Jadeite equity-adjusted results are available side by side.
- The e-commerce dashboard works consistently across companies and date ranges.
- Shopify and approved marketing-platform data update automatically, with clear refresh status and error alerts.
- AI analysis is based on approved source data, respects user access and allows the Admin to open the supporting information.
- Tasks, approvals, documents and important changes are controlled and traceable.
- The platform is practical, secure and easy to use.

- The Admin can add, deactivate, archive, restore and manage portfolio companies without losing historical records.
- Most available data is extracted automatically from approved systems, while manual entry is controlled and traceable.
- Every authorized employee can use AI to enhance work without gaining access to restricted information or bypassing approval controls.
- The Master Technical & Functional Specification in Appendix A forms part of this Scope of Work and defines the detailed intelligence calculations and dashboard requirements.

APP A

Master Technical & Functional Specification

Binding technical appendix for the Jadeite Intelligence Hub

This appendix forms part of the complete Scope of Work. The main document defines the Admin and employee journeys. This appendix defines the detailed e-commerce calculations, data visibility, metrics and intelligence requirements. If a technical feature is not visible on the main dashboard, it may be placed behind the relevant restricted module without being removed from scope.

A1. Project and reporting basis

Item	Requirement
Project title	Unified Multi-Brand E-Commerce Command Center within the Jadeite Intelligence Hub.
Brands in scope	All current and future approved portfolio brands.
Primary reporting currency	USD, with approved currency-conversion rules where source systems use another currency.
Segmentation	Every applicable metric should be filterable by brand/company, channel, campaign, country and reporting period.
Visibility	Data must be masked or revealed according to the user's approved company, role, module and item-level permissions.

A2. True Profit logic engine - five-tier waterfall

The system should calculate a standardized profitability waterfall for every available order and line item. Full CM1-CM5 visibility is restricted to approved Executive, Finance and Marketing users.

Tier	Metric	Calculation logic
Sales	Net Sales	Gross Sales - Refunded Value - Discounts
Tier 1	CM1 - Gross Margin	Net Sales - COGS derived from supplier PO/ERP data at SKU and colour level
Tier 2	CM2 - Contribution	CM1 - Actual outbound shipping invoice - Payment gateway fees
Tier 3	CM3 - Operating Profit	CM2 - Attributed advertising spend using approved attribution logic
Tier 4	CM4 - Post-Promotion Profit	CM3 - Marketing discount erosion / promotional value
Tier 5	CM5 - Net Final Profit	CM4 - Return shipping costs - Reverse-logistics processing fees

A3. Visibility, masking and company isolation

Role	Required visibility
------	---------------------

Role	Required visibility
Executive	Full portfolio and company visibility where authorized, including CM1-CM5, nCAC, nROAS, cash and consolidated performance.
Finance	CM1-CM5, accounting, reconciliation, supplier/cost, tax and cash information; creative engagement-only views may be restricted.
Marketing	CM1-CM5, campaign, acquisition and creative performance; supplier names, bank balances and restricted ERP OpEx may be masked.
Operations	Net sales, units, inventory, fulfilment, shipping and returns; CM1-CM5, ad spend, nCAC and restricted accounting information masked.
Company isolation	A user assigned only to one portfolio company cannot see another company unless additional access is granted.

A4. Marketing and acquisition intelligence

- nCAC: advertising spend divided by new customers whose order count is one.
- CAC: advertising spend divided by total acquired customers, according to the approved definition.
- nROAS: revenue from new customers divided by advertising spend.
- ROAS: total net revenue divided by advertising spend.
- CM4 per campaign: campaign contribution after advertising spend and promotional discount erosion.
- Hook Rate: three-second video views divided by total impressions, where supplied by the platform.
- Hold Rate: approved 50% and/or 100% video watch-rate measures, where supplied by the platform.
- Campaign Matrix: campaign, ad set, ad and creative performance with thumbnails and status guidance.

A5. Product and inventory intelligence

- Return rate per product, SKU, colour and size where data is available.
- Actual return logistics cost included at CM5.
- Items Sold Together / basket analysis showing commonly purchased SKU pairs.
- Inventory velocity based on a fourteen-day rolling average.
- Days of stock remaining calculated from current inventory and velocity.
- Upsell take-rate and incremental CM3/CM4 margin lift.
- Operations Radar for stockouts, dead stock and high-return products or variants.

A6. Customer, cohort and retention intelligence

- Cohort payback period: days for cumulative CM5 to recover the cohort's initial nCAC.
- 30-day, 60-day, 90-day and 365-day customer lifetime value based on cumulative CM5 margin.
- Retention-channel lift attributed to approved email and WhatsApp platforms, such as Klaviyo and Dondy, where integration and attribution permit.

A7. Logistics, country and financial reconciliation

- Country profitability with CM1-CM5 by market for authorized roles.
- Actual versus estimated shipping variance using Shopify checkout estimates and final carrier invoices for outbound and returns.
- Shipping cost as a percentage of net revenue by lane or country.
- Advertising spend audit comparing platform API spend with ERP/accounting charges; alert when the variance exceeds 5% unless Finance approves another threshold.
- Bank Bridge matching Shopify payouts with accounting-system bank deposits.
- Estimated VAT or sales-tax liability by jurisdiction, subject to Finance validation and local tax rules.

A8. Required intelligence views

View	Requirement
Executive Command Center	High-level Net Sales, CM5, nCAC, cash on hand, status, risks and equity-adjusted group results.
Marketing Matrix	Campaigns versus nCAC, nROAS and CM4 with creative thumbnails and drill-through.
Country Map	Interactive geographic view of CM5 or the best available profitability measure by country.
Operations Radar	Stockout, dead-stock, high-return and fulfilment alerts.
Waterfall Drill-Through	Click an order, campaign or relevant result and trace Gross Sales through CM5 for authorized roles.
Actionable Insights	AI-supported recommendations such as Scale, Maintain, Review, Pause, Reorder or Investigate, always subject to human approval.

APP B

Approved E-Commerce Dashboard Reference

Visual navigation and dashboard structure to carry into the clickable prototype

The prototype should follow this clean, easy-to-read pattern. Portfolio company tabs remain visible at the top, the selected company is highlighted, and the Admin can change the date range without leaving the page. The final platform may refine the visual design, but it should preserve this ease of navigation and information hierarchy.
